Earnings Volatility & Options Desk

Can issuer evidence, an event scenario and an auditable option payoff live in one research workspace?

Local application with hypothetical default quotes | 5 November 2026

THE RESULT The example includes a sourced AAPL evidence pack and hypothetical prices. A previous authenticated AAPL retrieval is documented. On 5 November 2026, 42 backend tests passed and one failed because its October event fixture had expired; provider benchmarks remain unrun.

APPROACH

React/FastAPI combines a curated AAPL evidence pack, optional SEC ingestion, delayed quotes and Black-Scholes scenarios. A saved snapshot separates assumptions, deterministic numbers and model opinion; citation IDs and structured output are checked.

SCOPE & LIMITATIONS

Initial editorial analysis is authored, not a model run. Source/citation validity does not prove factual support. Event variance, historical move distributions, American exercise and exit frictions are incomplete. Storage and deployment are single-user local. The date-sensitive test failure must be addressed for a current automated demonstration.

EXPLORE

Build frontend, start uvicorn on port 8001, inspect the hypothetical pack, edit assumptions and export a snapshot. The live provider and paid-model paths are optional.
